

Genetic Carrier Screening

- The average person carries approximately 6-8 genetic variation, or mutations, in their genes
- Approximately 80% of carriers have no family history of the disorder
- There are genetic panels that can detect mutations in hundreds of genes
- Testing addresses many of the more serious genetic disorders, but not all of them
- Some conditions identified are treatable
- Carriers of certain conditions are at an increased risk for health issues

**You may choose or decline genetic screening.
